UPSTABILIZER

Soma offers a new vibration dampener to apply directly to the bow. Compared to various other products on the market this vibration dampener is particularly effective thanks to its original construction.

The body is made of an aluminum cylinder in which two inner high density rubber layers are fixedly inserted. Between these two layers there is a high vibration absorption capacity foam.

The Upstabilizer is completed with a rubber damper and a head weight.

Thread to add the Upstabilizer directly to the bow. The most common positioning is in the upper part of the riser, for a perfect balance.

A 6 color variety to choose the perfect match for your bow.

Soma Upstabilizer, an accessory you must test on your bow.
